

Product Design Services

At the centre of ALAR's design and engineering department is the latest Radan CAD/CAM system. 2D and 3D visualising and a DNC link provide a sophisticated electronic transfer between customers design engineers and high speed fully automated punching and laser cells.

Electronic drawing data can be received in 2D drawing formats such as DXF or DWG 3D formats in SAT or IGES.

Our engineers look to work closely with customers at an early stage to identify the best method of manufacture and construction and to eliminate any unnecessary operations, so that the components are made in the most cost efficient way.
